

This is a bunch of code to test if the converter correctly converts it to RW ready HTML. It can also be used as an example of how to use markdown.

Headings:

This is a h1 heading

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer velit nisi, hendrerit ut lorem quis, condimentum volutpat ligula. Phasellus maximus nisi id accumsan ornare. In interdum ante ut lectus euismod facilisis. Nullam pretium laoreet diam, et suscipit ex mattis sed.

This is a h2 heading

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer velit nisi, hendrerit ut lorem quis, condimentum volutpat ligula. Phasellus maximus nisi id accumsan ornare. In interdum ante ut lectus euismod facilisis. Nullam pretium laoreet diam, et suscipit ex mattis sed.

This is a h3 heading

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer velit nisi, hendrerit ut lorem quis, condimentum volutpat ligula. Phasellus maximus nisi id accumsan ornare. In interdum ante ut lectus euismod facilisis. Nullam pretium laoreet diam, et suscipit ex mattis sed.

This is a h4 heading

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer velit nisi, hendrerit ut lorem quis, condimentum volutpat ligula. Phasellus maximus nisi id accumsan ornare. In interdum ante ut lectus euismod facilisis. Nullam pretium laoreet diam, et suscipit ex mattis sed.

On RW.com, only the h2, h3 and the bold tag you'll see below are supported.

Formatting tags

This **text** contains several **bold** words. They emphasize **certain** words. This is also called strong emphasis. Use `**` to create these.

The *italic* formatting can be good to use in certain, *rare* situations. There are multiple ways of making words italic. This is called *emphasis*.

Strikethrough uses two tildes. I love using ~~UE4~~ Unity to make ~~movies~~ games!

Use a `*\backslash**` to escape any `*unwanted*` formatting.

[Links](https://www.google.com) are added by using both [square and round brackets](https://www.raywenderlich.com). If you just add the full URL like https://www.raywenderlich.com that also works.

If you leave add an exclamation sign before the link, it turns into an image instead:

Lots of formats are supported, including GIFs of course:

Make sure to add a separate child folder of the folder your markdown is in, you can easily use subfolders in links and images.

The converter can find all locally sourced images, upload them to WordPress and replace the local paths with the image URLs.

Lists

Lists can be used for making a collection of instructions or items:

- Something blue.
